

ALGO

- Setup of an Angular Project:
Create a project, specify components, and configure routing using the Angular CLI.
- Establish Database Configuration:
For potential backend interactions, provide a db.json file.
- HTML and Style:
For styling components, use Bootstrap and distinct CSS files.
- Put Components Into Practice:
Provide elements with particular functions.
- Flow in Application Component:
Configure Angular Router to navigate components.
- Logic of Application:
Implement user authentication and form validation logic, manage submissions, and respond to API requests.
